

1.4 · Team Agent-Design Workshop

Week 2 · Monday Jul 20 — LLMs and Agentic AI Workflows

Afternoon workshop · 1:15-2:45 (90 min)

Generative AI & Sustainability · Munich Summer School 2026

Session goal

Turn this morning's building blocks into your startup's **three agent use cases**, each with a complete six-box agent map — plus one prototype idea you could demo Thursday.

Steps

- Define at least three agents for the learning space
- Select three priority use cases
- Decide where each workflow uses prompts, retrieval, tools, memory, or routing
- Draft an agentic workflow diagram
- Identify human-review steps, limitations, and failure modes
- Identify a first prototype idea

Deliverables by end of session

- Workflow diagram draft
- Three selected use cases
- First prototype idea

Time and checkpoints

- 1:15–1:45 — shortlist agents against Week 1 interview needs; pick your three
- **1:45 checkpoint** — say your three picks out loud to an instructor before mapping
- 1:45–2:30 — draw one six-box agent map per agent (input, decision, tools/data, output, human approval, failure mode)
- **2:30 share-out** — each team presents one map in 2 minutes; the other team names the weakest box
- 2:30–2:45 — patch the weak boxes; write down your first prototype idea

Tonight's reading — due tomorrow 10:10

Morrison et al., **Holistically Evaluating the Environmental Impact of Creating Language Models** (ICLR 2025)

- Paper: <https://arxiv.org/abs/2503.05804>
- Use the reading guide: `assignments/reading-guide-environmental-impact-of-llms.md`
- Budget 60–90 minutes; the guide tells you what to skim
- Bring your **written admission ticket** (three short items) — it is your entry to tomorrow's discussion and counts toward participation
